The Physical Signature of Computation Neal G. Anderson, Gualtiero Piccinini, 2024-07-12 In The Physical Signature of Computation Neal Anderson and Gualtiero Piccinini articulate and defend the robust mapping account the most systematic rigorous and comprehensive account of computational implementation to date Drawing in part from recent results in physical information theory they argue that mapping accounts of implementation can be made adequate by incorporating appropriate physical constraints According to the robust mapping account the key constraint on mappings from physical to computational states the key for establishing that a computation is physically implemented is physical computational equivalence evolving physical states bear neither more nor less information about the evolving computation than do the computational states they map onto When this highly nontrivial constraint is satisfied among others that are spelled out as part of the account a physical system can be said to implement a computation in a robust sense which means that the system bears the physical signature of the computation Anderson and Piccinini apply their robust mapping account to important questions in physical foundations of computation and cognitive science including the alleged indeterminacy of computation pancomputationalism

and the computational theory of mind They show that physical computation is determinate nontrivial versions of pancomputationalism fail and cognition involves computation only insofar as neurocognitive systems bear the physical signature of specific computations They also argue that both consciousness and physics outstrip computation

**History of Nordic Computing 2** John Impagliazzo, Timo Järvi, Petri Paju, 2009-09-21 The First Conference on the History of Nordic Computing HiNC1 was organized in Trondheim in June 2003 The HiNC1 event focused on the early years of computing that is the years from the 1940s through the 1960s although it formally extended to year 1985 In the preface of the proceedings of HiNC1 Janis Bubenko Jr John Impagliazzo and Arne S lvsberg describe well the peculiarities of early Nordic computing 1 While developing hardware was a necessity for the first professionals quite soon the computer became an industrial product Computer scientists among others grew increasingly interested in programming and application software Progress in these areas from the 1960s to the 1980s was experienced as astonishing The developments during these decades were taken as the focus of HiNC2 During those decades computers arrived to every branch of large and medium sized businesses and the users of the computer systems were no longer only computer specialists but also people with other main duties Compared to the early years of computing before 1960 where the number of computer projects and applications was small capturing a holistic view of the history between the 1960s and the 1980s is considerably more difficult The HiNC2 conference attempted to help in this endeavor

**Geometric Modeling and Mesh Generation from Scanned Images** Yongjie Jessica Zhang, 2018-09-03 Cutting Edge Techniques to Better Analyze and Predict Complex Physical Phenomena Geometric Modeling and Mesh Generation from Scanned Images shows how to integrate image processing geometric modeling and mesh generation with the finite element method FEM to solve problems in computational biology medicine materials science and engineering Based on the author's recent research and course at Carnegie Mellon University the text explains the fundamentals of medical imaging image processing computational geometry mesh generation visualization and finite element analysis It also explores novel and advanced applications in computational biology medicine materials science and other engineering areas One of the first to cover this emerging interdisciplinary field the book addresses biomedical material imaging image processing geometric modeling and visualization FEM and biomedical and engineering applications It introduces image mesh simulation pipelines reviews numerical methods used in various modules of the pipelines and discusses several scanning techniques including ones to probe polycrystalline materials The book next presents the fundamentals of geometric modeling and computer graphics geometric objects and transformations and curves and surfaces as well as two isocontouring methods marching cubes and dual contouring It then describes various triangular tetrahedral and quadrilateral hexahedral mesh generation techniques The book also discusses volumetric T-spline modeling for isogeometric analysis IGA and introduces some new developments of FEM in recent years with applications

*Numerical Computation of Electric and Magnetic Fields* Charles W. Steele, 2013-03-09 For well over a decade the numerical approach to field computation has been gaining

progressively greater importance Analytical methods offield compu tation are at best unable to accommodate the very wide variety of configura tions in which fields must be computed On the other hand numerical methods can accommodate many practical configurations that analytical methods cannot With the advent of high speed digital computers numerical field computations have finally become practical However in order to implement numerical methods of field computation we need algorithms numerical methods and mathematical tools that are largely quite different from those that have been traditionally used with analytical methods Many of these algorithms have in fact been presented in the large number of papers that have been published on this subject in the last two decades And to some of those who are already experienced in the art of numerical field computations these papers in addition to their own original work are enough to give them the knowledge that they need to perform practical numerical field computations
