Zimmermann, 1984-01-01 For the first time this book unites different algebraic approaches for discrete optimization and operations research The presentation of some fundamental directions of this new fast developing area shows the wide range of its applicability Specifically the book contains contributions in the following fields semigroup and semiring theory applied to combinatorial and integer programming network flow theory in ordered algebraic structures extremal optimization problems decomposition principles for discrete structures Boolean methods in graph theory and applications **Journal of Research of the National Bureau of Standards** United States. Gary Parker, Ronald L. Rardin, 2014-06-28 This book treats the fundamental issues and algorithmic strategies emerging as the core of the discipline of discrete optimization in a comprehensive and rigorous fashion Following an introductory chapter on computational complexity the basic algorithmic results for the two major models of polynomial algorithms are introduced models using matroids and linear programming Further chapters treat the major non polynomial algorithms branch and bound and cutting planes The text concludes with a chapter on heuristic algorithms Several appendixes are included which review the fundamental ideas of linear programming graph theory and combinatorics prerequisites for readers of the text Numerous exercises are included at the end of each chapter *Network Design with Applications to Transportation and Logistics* Teodor Gabriel Crainic, Michel Gendreau, Bernard Gendron, 2021-07-16 This book explores the methodological and application developments of network design in transportation and logistics It identifies trends challenges and research perspectives in network design for these areas Network design is a major class of problems in operations research where network flow combinatorial and mixed integer optimization meet The analysis and planning of transportation and logistics systems continues to be one of the most important application areas of operations research Networks provide the natural way of depicting such systems so the optimal design and operation of networks is the main methodological area of operations research that is used for the analysis and planning of these systems This book defines the current state of the art in the general area of network design and then turns to its applications to transportation and logistics New research challenges are addressed *Network Design with Applications to Transportation and Logistics* is divided into three parts Part I examines basic design problems including fixed cost network design and parallel algorithms After addressing the basics Part II focuses on more advanced models Chapters cover topics such as multi facility network design flow constrained network design and robust network design Finally Part III is dedicated entirely to the potential application areas for network design These areas

range from rail networks to city logistics to energy transport All of the chapters are written by leading researchers in the field which should appeal to analysts and planners
