Agents Andrea Omicini, Franco Zambonelli, Matthias Klusch, Robert Tolksdorf, 2013-11-27 As today's most complex computing environment the Internet confronts IT researchers, system designers and application developers with completely new challenges and as a fascinating new computing paradigm agent technology has recently attracted broad interest and strong hopes for shaping the future information society. Relating both the Internet and agents opens up a whole new range of advanced applications in vibrant subfields of information technology such as middleware, mobile commerce, e-learning, collaborative working and intelligent information services. Many modern advanced systems are likely to exploit Internet agents and exploiting Internet agents mostly means dealing with coordination models and technologies of various sorts. This monograph like anthology is the first systematic guide to models and enabling technologies for the coordination of intelligent agents on the Internet and respective applications. Data Structures, *Bookseller*, 1998 **Core Java 1.1** Cay S. Horstmann, Gary Cornell, 1997 Software Programming Languages Proceedings of the IEEE and ACM International Symposium on Augmented Reality, 2000 Augmented reality involves areas of signal processing, computer vision, user interfaces, wearable computing, computer networks and information visualization. The 23 papers presented at the October 2000 symposium overview the latest research in this relatively new field. The main subjects are information presentation and large environments, head mounted displays, vision based methods and non optical calibration and tracking. Topics include development of a lightweight head mounted operating microscope augmenting buildings with infrared information, markerless tracking using planar structures in the scene and autocalibration of an electronic compass in an outdoor augmented reality system. Joubert, Frans Peters, 2018-03-15 The most powerful computers work by harnessing the combined computational power of millions of processors and exploiting the full potential of such large scale systems is something which becomes more difficult with each succeeding generation of parallel computers. Alternative architectures and computer paradigms are increasingly being investigated in an attempt to address these difficulties. Added to this the pervasive presence of heterogeneous and parallel devices in consumer products such as mobile phones, tablets, personal computers and servers also demands efficient programming environments and applications aimed at small scale parallel systems as opposed to large scale supercomputers. This book presents a selection of papers presented at the conference Parallel Computing ParCo2017 held in Bologna, Italy on 12 to 15 September 2017. The conference included contributions about alternative approaches to achieving High Performance Computing (HPC) to potentially surpass exa and zetascale performances as well as papers on the application of quantum computers and FPGA processors. These developments are aimed at making available systems better capable of solving intensive computational scientific engineering problems such as climate models, security applications and classic NP problems some of which cannot currently be managed by even the most powerful supercomputers available. New areas of application such as robotics, AI and learning systems, data science, the

Internet of Things IoT and in car systems and autonomous vehicles were also covered As always ParCo2017 attracted a large number of notable contributions covering present and future developments in parallel computing and the book will be of interest to all those working in the field
