

## INTRODUCTION TO GENETIC ENGINEERING

- Biotechnology deals with techniques of using live organisms or enzymes from organisms to produce products and processes useful to humans.
- In this sense, making curd, bread or wine, which are all microbe-mediated processes, could also be thought as a form of biotechnology.
- Further, many other processes/techniques are also included under biotechnology. For example, in vitro fertilisation leading to a 'test-tube' baby, synthesising a gene and using it, developing a DNA vaccine or correcting a defective gene, are all part of biotechnology.

## PRINCIPLES OF BIOTECHNOLOGY

- Among many, the two core techniques that enabled birth of modern biotechnology are :
  - (i) **GENETIC ENGINEERING** : Techniques to alter the chemistry of genetic material (DNA and RNA), to introduce these into host organisms and thus change the phenotype of the host organism
  - (ii) **BIOPROCESS ENGINEERING**: Maintenance of sterile (microbial contamination-free) ambience in chemical engineering processes to enable growth of only the desired microbe/eukaryotic cell in large quantities for the manufacture of biotechnological products like antibiotics, vaccines, enzymes,

- (i) **GENETIC ENGINEERING**: This involves the use of recombinant DNA technology to alter the genetic material of an organism. This is done by inserting a foreign DNA fragment into a plasmid or a virus, which then acts as a vector to introduce the foreign DNA into the host organism.
- (ii) **BIOPROCESS ENGINEERING**: This involves the use of sterile conditions and controlled environments to grow microorganisms in large quantities for the production of biotechnological products. This is done by using sterile media and equipment, and by controlling the growth conditions of the microorganisms. This can be done by using a bioreactor or a fermenter.
