Zdonik, David Maier, 1990 This comprehensive collection is a survey of research in object oriented databases offering a substantive overview of the field section introductions and over 40 research papers presented in their original scope and detail The balanced selection of articles presents a confluence of ideas from both the language and database research communities that have contributed to the object oriented paradigm The editors develop a general definition and model for object oriented databases and relate significant research efforts to this framework Further the collection explores the fundamental notions behind object oriented databases semantic data models implementation of object oriented systems transaction processing interfaces and related approaches Research and theory are balanced by applications to CAD systems programming environments and office information systems **Building Object Applications that Work** Scott W. Database Systems Klaus R. Dittrich, 1988 This volume collects papers presented at the 2nd International Workshop on Object Oriented Database Systems ooDBS II held at the Ebernburg near Bad M nster am Stein FRG in September 1988 It thus gives a comprehensive overview of the latest developments in this flourishing area of current database research Object oriented database systems have been approached with mainly two major intentions in mind namely to better support new application areas like CAD CAM office automation knowledge engineering and to overcome the impedance mismatch between data models and programming languages The notion of object orientation in database systems is thus a broader one than e g in the area of programming languages Structural object orientation provides for data model mechanisms that allow the direct representation and manipulation of highly structured entities behavioral object orientation cares for facilities to associate arbitrary user defined type specific operations with data entities finally full object orientation tries to combine the advantages of both categories Though data model concepts are the decisive feature of object oriented database systems numerous other system aspects have to be reconsidered or allow better solutions respectively in this light They include e g transactions implementation techniques optimization formalization the inclusion of rules and the integration with other systems A number of research prototypes and even some commercial systems are meanwhile available Both approaches to extend databases with object oriented capabilities and approaches to extend object oriented programming languages with database features have been and are being investigated *Interfaces to Database Systems (IDS94)* Peter H.

Sawyer, 2013-11-11 A brief survey of the major DBMS and HeI conference proceedings over the past 10 years will reveal isolated pockets of research in database user interfaces but little sense of being swept along with the general advances in DBMS technology and HeI New data models have evolved to meet the needs of different application domains persistent programming languages are blurring the traditional distinction between data definition and application programming languages distribution and inter operability have become issues as have the storage of heterogeneous media types yet it is still rare to read of the HeI issues raised by these technological innovations being expressly addressed and rarer still to find recognition of the usability problems with longer established database technologies There are at least two reasons why this should be surprising Database systems are not like other computer systems existing both as back ends to other applications and as stand alone data stores they are typically slow deal with very large volumes of data and can involve all sorts of security confidentiality and even cooperability issues Databases are everywhere Perhaps only word processors and spread sheets are more widespread In addition as business cultures change and personal computing continues to mould expectations end users find themselves interacting increasingly closely with database systems **Object-oriented**
