*Dynamic Vision: From Images To Face Recognition* Shaogang Gong, Stephen J Mckenna, Alexandra Psarrou, 2000-05-11

Face recognition is a task that the human vision system seems to perform almost effortlessly yet the goal of building computer based systems with comparable capabilities has proven to be difficult The task implicitly requires the ability to locate and track faces through often complex and dynamic scenes Recognition is difficult because of variations in factors such as lighting conditions viewpoint body movement and facial expression Although evidence from psychophysical and neurobiological experiments provides intriguing insights into how we might code and recognise faces its bearings on computational and engineering solutions are far from clear The study of face recognition has had an almost unique impact on computer vision and machine learning research at large It raises many challenging issues and provides a good vehicle for examining some difficult problems in vision and learning Many of the issues raised are relevant to object recognition in general This book describes the latest models and algorithms that are capable of performing face recognition in a dynamic setting The key question is how to design computer vision and machine learning algorithms that can operate robustly and quickly under poorly controlled and changing conditions Consideration of face recognition as a problem in dynamic vision is perhaps both novel and important The algorithms described have numerous potential applications in areas such as visual surveillance verification access control video conferencing multimedia and visually mediated interaction The book will be of special interest to researchers and academics involved in machine vision visual recognition and machine learning It should also be of interest to industrial research scientists and managers keen to exploit this emerging technology and develop automated face and human recognition systems It is also useful to postgraduate students studying computer science electronic engineering information or systems engineering and cognitive psychology

Face Detection and Modeling for Recognition Rein-Lien Hsu, 2002 Face recognition has received substantial attention from researchers in biometrics computer vision pattern recognition and cognitive psychology communities because of the increased attention being devoted to security man machine communication content based image retrieval and image video coding We have proposed two automated recognition paradigms to advance face recognition technology Three major tasks involved in face recognition systems are i face detection ii face modeling and iii face matching We have developed a face detection algorithm for color images in the presence of various lighting conditions as well as complex backgrounds Our detection method first corrects the color bias by a lighting compensation technique that automatically estimates the parameters of reference white for color correction We overcame the difficulty of detecting the low luma and high luma skin tones by applying a nonlinear transformation to the Y CbCr color space Our method generates face candidates based on the spatial arrangement of detected skin patches We constructed eye mouth and face boundary maps to verify each face candidate Experimental results demonstrate successful detection of faces with different sizes color position scale orientation 3D pose and expression in

several photo collections 3D human face models augment the appearance based face recognition approaches to assist face recognition under the illumination and head pose variations For the two proposed recognition paradigms we have designed two methods for modeling human faces based on i a generic 3D face model and an individual s facial measurements of shape and texture captured in the frontal view and ii alignment of a semantic face graph derived from a generic 3D face model onto a frontal face image
